MENU command

The **MENU** command is used to load the custom files.

Command Access:

Command : MENU

Function Description:

In the "Options Customization Files" dialog box, users could select or input the custom file name. Those custom files are based on XML files; they could be customized menu, toolbar, workspace, and other interface elements. Users could also create customized files and use the MENU or CUI commands to load them.
Note: in early versions, users use traditional files, such as traditional menu files (MNS), traditional menu template (MNU) and customized files (CUI). Now those types of files have been replaced by another kind of file type called CUIx. That is to say: the CUIx files based on XML.
