REFSET command

The **REFSET** command is used to add or remove objects from a working set when editing in-place.

Command Access:

Menu : Tools > Xref and Block In-place Editing > Add to working set
Menu : Tools > Xref and Block In-place Editing > Remove from Working Set
Command : REFSET

Command Prompts:

Transfer objects between the Ref Edit working set and host drawing...
Enter an option [Add/Remove] :

Function Description:

Objects in working set are different from other objects in current drawing. In current drawing, objects beyond working set are fade-in.
Add:
Add objects to a working set.
As part of working set, the objects will be added to a reference and removed from current drawing when saving all changes. The "Add to working set" button on "Reference edit" dialog box will prompt users to add objects to working set rather than the REFCLOSE command.
Remove:
Remove objects from working set.
The objects removed from working set will be removed from reference too, as well removed from current drawing. The "Remove from working set" button on the "Reference edit" dialog box will prompt users to remove objects from working set rather than the REFCLOSE command.
