MSLIDE Command

[GstarCAD 2027](#) · [Command Reference](#)

Commands > M Command > MSLIDE

Function Description:

This command is used to create a slide file for the current model or layout.

Users can enter a file name or select a slide from the Create Slide File dialog

box. The slide file is a raster image of a layout. In the model space, the MSLIDE

command can create a slide of the current layout; in the paper space, it can create a slide of drawing space containing all viewports with their contents.

The slide file can not contain the drawing beyond screen and layers turned off or frozen.

Users can use the VSLIDE command to view slides.

Makes the slide colored by the SHADE command. If the viewport that used to color it is much bigger than that created, or the coloring resolution is higher than that created, users may find some black lines distributed sporadically in colored drawing when viewing it. In order to avoid this situation, please set the resolution to the highest of full screen when creating slide files.
