ARRAY Command

[GstarCAD 2027](#) · [Command Reference](#)

Commands > A Command > ARRAY

Function Description:

This command is used to create copies of objects arranged in rectangular and polar pattern. The array is as a whole (dynamic block). It can be dynamically adjusted the number of ranks, spacing and other related parameters through Ribbon Panel and Multifunctional Grips.

Each element in an array is called array project, which can contain multiple objects. You can also specify blocks as source objects for arrays. If you choose the path array, you also need a straight line, a polyline, a three-dimensional polyline, a spline, a helix, an arc, a circle, or an ellipse to use as a path. For different array types, the Ribbon panel provides different parameter setting options.

Command Access:

Menu: /

Ribbon: /

Toolbar: Modify > Array...

Command: ARRAY

Alias: AR

Command Prompts:

Select object:

Enter array type [Rectangular/PAth/POlar]

<Rectangular>:
