Object Snap Options

[GstarCAD 2027](#) · [Whats New](#)

Innovative Features > Object Snap Options

Now within "Object Snap" tab, you can find a new added option called *Distance from Endpoint*. This option allows snap a certain distance from any endpoint of objects like line, arc, spline, pline, ellipse arc, mline and any other lines. As long as you pass the cursor over an object from its endpoints, you will see a green snap point at accurate distance.

And within "Object Snap" tab, you can find a new added option called *Divide Segments*. This option allows snap the divided segment points of objects like line, arc, spline, pline, ellipse arc, mline and any other lines. Before, if you want to find the divide point, first you need to generate the divided points object, then snap those points to draw. Now as long as you pass the cursor over an object mentioned above, you will see a green snap point at accurate distance.

On Drafting Settings window, under Object Snap tab, when you select both Distance from Endpoint and Divide Segments options, and you draw an object on the current drawing, you will see at status bar the respective snap options you selected before. So you can easily entry new values for both options.
