About Moving Objects

[GstarCAD 2027](#) · [Command Reference](#)

Objects can be moved to a different location or rotated to a new orientation.

Move Objects

To move objects at a specified distance or direction from the original, you can use coordinates, grid snap, object snaps and other tools.

Specify Distance with Two Points

Move an object using the distance and direction specified by a base point followed by a second point.

Use a Stretch-Move

If the endpoints of an object are all completely located in the selection window, you can also move objects with STRETCH command. If you want to move objects at a specific angle, you have to turn on Ortho mode or polar tracking. Only the endpoints that lie within the crossing selection will be moved as a result.
