Draw multilines

[GstarCAD 2027](#) · [Command Reference](#)

Multiline objects are created by using the MLINE command. A multiline is composed of 1-16 parallel lines (two lines by default).

The STANDARD style for drawing a multiline has two elements. You can create new styles and modify their definition by MLSTYLE. You can specify quantity of lines, offset, color, linetype and so on.

Create and Edit Multiline Styles

If you have many styles, select one style as current style before drawing multilines. You can also specify the justification and scale of multilines.

You can open the "Multilines Edit Tools" dialog box by MLEDIT command or double clicking the mline.
